

Invisalign Coquitlam

Invisalign is another solution to conventional metal braces. They are see-through removable aligners that provide the client a more aesthetic benefit over other orthodontic treatments. Invisalign braces are see-through custom aligners that are really comfortable to wear, yet durable, and removable for times when you have to floss, brush, drink, or eat. The aligners might have to be switched approximately every two weeks to another aligner that helps the teeth shift closer to their desired position.

A typical Invisalign case may take about a year to complete, which is less alignment time than conventional braces. You will likely have to see your dentist each month or so to evaluate the progress. During these appointments you will be given additional aligners to carry on your program. One complete alignment with Invisalign may consist of anywhere between 18 to 30 aligners to be worn the whole time, with the amount depending on the severity of every case.

In most cases, Invisalign may be utilized to treat orthodontic issues in both teens and adults. They might be utilized to treat crossbites, crowding, overbites, widely spaced teeth, and underbites.

The main advantages to the see-through aligners are no metallic wires or bands to aggravate the mouth and most people will not perceive you are wearing Invisalign as they are virtually invisible.
