

Cosmetic Dentist Coquitlam

Traditional or Family dentistry has maintained a concentration on prevention and general oral hygiene, through analysis and treatments of oral health conditions. Cosmetic dentistry conversely has focused on improving the visual attractiveness of a persons smile, teeth, and mouth. So, family dentistry concentrates on dental issues that require pressing treatments, whilst aesthetic dentistry caters its services to the desires and wants of the patient.

Some aesthetic treatment options can also be used for restorative purposes such as indirect fillings, which has become incredibly common for treating patients with injured or decayed teeth. On the whole dental fillings in previous decades have been made of gold, silver amalgam (fused with mercury), and other materials that were not always satisfying aesthetically.

Now fillings can be designed out of composite or porcelain ceramic materials that will ultimately resemble the natural colour, size, and shape of your teeth. Typically these certain types of fillings will get categorized as aesthetic enhancements and patients are now choosing to exchange their older fillings with new aesthetic tooth coloured fillings that may also help upgrade their smiles.

Future Cosmetic Dentistry Trends

Today's advancements in dental materials allows for perfectly natural tooth-colored dental cosmetics that make restorative dental remedies much more resilient than in prior years. In addition, dentists are at this time using more moderate cosmetic methods to preserve as much of your natural tooth structure as possible.

The many aesthetic therapies include composite resin bonding, onlays/inlays, teeth bleaching and whitening, dental implants, dental veneers, smile makeovers, and full mouth reconstructions.

Inlays/Onlays

Onlays and Inlays fillings can be custom fabricated from tooth-coloured porcelain or composite resin materials that provide longer lasting results for patients with decaying teeth or teeth with structural impairment. Traditional fillings differ from indirect fillings in that they are molded into position during your visit to the dentist, while Inlays and Onlays must be custom fabricated in a specialized dental laboratory prior to being cemented onto your tooth by your oral health care professional.

Dental Composites Bonding

Broken, cracked, chipped, corroded and discolored teeth can be refurbished or have their appearance enhanced by means of a treatment referred to as composite bonding. Composite resin materials look and feel like ordinary dentin and tooth enamel when positioned into a tooth opening or onto a tooth's exterior, may be contoured, sculpted and hardened into shape with a high-intensity light. The resulting restoration will consistently blend in with the rest of the surrounding teeth and structures to increase your smile.

Cosmetic Dental Whitening

Bleaching or teeth whitening is time and again the most recommended aesthetic dental procedure. Whitening teeth can improve the cosmetic appeal of teeth that have become stained from smoking, consuming coffees, teas, colas, or red wines, or eating various foods.

Dental Veneers

Ceramic or Composite covers can be cemented directly to the tooth's surface to help restore chipped or cracked teeth as well as enhancing the look of severely discoloured teeth. Also, veneers might be used to close the gaps between teeth or to enrich discoloured teeth that have not been successful with whitening treatments.

Artificial Tooth Roots

Dental Implants are synthetic tooth root replacements used when a patient has lost a tooth or many teeth. When used it is part of a dental prosthetic that can enrich a smile or be used to give structure to an area lacking a foundation. Absent teeth may trigger the face to sag or collapse, rendering an older appearance.

Smile Makeover

Making over a smile will require a widespread evaluation of your smile aesthetics. In order to alter your overall appearance one or more treatments will be required to help you realize the resulting appearance that you want. These types of procedures might include implants, veneers, gum sculpting, or advanced whitening treatments.

Full Oral Reconstructions

Full mouth reconstructions are unlike from the smile makeover in that there is also a focus on issues relating to the functioning of the teeth. These may well include bone, bite, structure, muscles, and teeth troubles. At some point in your cosmetic assessment, your oral health care professional could propose certain necessary therapies to tweak these structural concerns.

There are many cosmetic alternatives for patients wishing to upgrade their smiles.
