

Coquitlam Cosmetic Dentist

Family Dentistry focuses on treating and preventing oral disease. Cosmetic Dentistry concentrates on improving the appearance of a person's mouth and smile. Cosmetic dentistry also provides restorative benefits. Dental fillings are used to treat and restore decayed teeth. Most fillings were composed of amalgam, gold, and other materials that were known to leave visible markings on the teeth. Today, you can choose fillings that strongly match the color of your teeth. The majority of these fillings are constructed of composite materials or porcelain. Consequently, most people now see very little difference between their fillings and their natural teeth.

Such advancements in technology have made today's cosmetic treatments to a large extent more predictable and longer lasting than before. Additionally, dentists are now using more conservative cosmetic dentistry techniques to preserve as much of your natural tooth structure as possible, depending upon your precise medical circumstances. Cosmetic dentists may also exploit such technologies as lasers in order to perform a number of procedures necessary for cosmetic treatments in their own offices. This makes cosmetic dental procedures such as smile makeovers more comfortable and convenient for patients, as well as helps to cut down recuperation time. Some of the more common Cosmetic Dentistry Treatments are:

1. Dental Implants

Implants are artificial tooth root replacements that are used to compensate for tooth loss. The result is typically an enhanced smile and a more youthful appearance.

2. Inlays/Onlays

Porcelain or composite Inlays and onlays are a durable and cosmetic way to provide fillings to teeth with structural damage.

3. Composite Bonding

Chipped, broken, discolored or decayed teeth may be repaired or have their appearance corrected using a procedure referred to as composite bonding. A dental composite material with the appearance of enamel and dentin is applied into the cavity or on the surface of a tooth, where it is then sculpted into shape, contoured and hardened with a high-intensity light. The outcome is a restoration that blends invisibly with the remainder of the adjoining tooth structure and the rest of your natural teeth to generate a healthy, bright smile.

4. Full Mouth Reconstruction

While consulting with you about a smile makeover to primarily enrich the esthetic look of your smile, your dentist could notice that there is a need to give crucial treatment to remedy functional problems with your bite, muscles, teeth and bone structure. If you want full mouth restoration, the materials available nowadays make it possible for your dentist to provide you with durable, functional and clinically sound treatments that also appear natural.

5. Tooth Whitening

Teeth whitening is possibly the most frequently recommended cosmetic dentistry procedure. Teeth are frequently blemished from smoking, food, drink (coffee, tea or red wine) or poor oral hygiene. Bleaching the teeth can improve the appearance of your smile.

6. Dental Veneers (Composite and Porcelain)

Composite or porcelain laminates that are adhesively bonded to the surface of a tooth to remedy and repair chips and cracks will enhance a worn appearance or severe tooth staining. Veneers may also be recommended if you have gaps in your teeth or if you have not had success with teeth whitening.
